Import necessary libraries

```
import numpy as np
import pandas as pd
import seaborn as sns
import matplotlib.pyplot as plt
from sklearn.preprocessing import LabelEncoder
from sklearn.model_selection import train_test_split
from sklearn.preprocessing import StandardScaler
from sklearn.ensemble import RandomForestClassifier
from sklearn.metrics import accuracy_score, classification_report,
confusion_matrix
```

Load the dataset

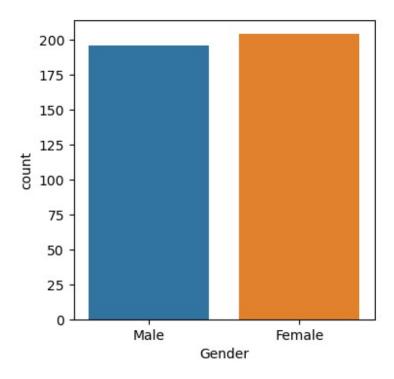

```
# Assuming the dataset is in a CSV file named 'PlayTennis.csv'
df = pd.read_csv('Social_Network_Ads.csv')
```

Dataset Visualization

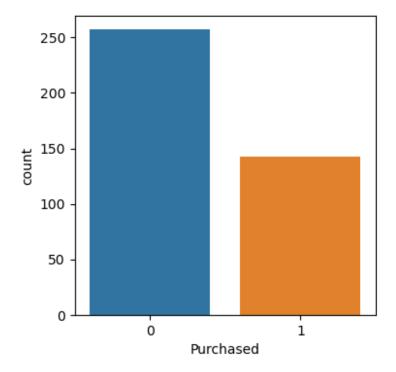

```
df.head()
                   Age
                                        Purchased
   User ID Gender
                        EstimatedSalary
0
  15624510
              Male
                    19
                                  19000
1
 15810944
              Male
                    35
                                  20000
                                                0
2 15668575 Female 26
                                                0
                                  43000
3 15603246 Female
                    27
                                  57000
                                                0
4 15804002
              Male 19
                                  76000
                                                0
df.shape
(400, 5)
```

EDA

```
ax = plt.subplots(figsize = (4,4))
ax = sns.countplot(x=df['Gender'])
plt.show()
```

```
ax = plt.subplots(figsize = (4,4))
ax = sns.countplot(x=df['Purchased'])
plt.show()
```

Feature Extraction

```
# Separate features (X) and target variable (y)
X = df.iloc[:, [1, 2, 3]].values # Considering Gender, Age, and
Estimated Salary as features
y = df.iloc[:, 4].values # Assuming 'Purchased' is the target
variable
```

Use LabelEncoder for 'Gender' as 'Gender' is non-numeric

```
label_encoder = LabelEncoder()
X[:, 0] = label_encoder.fit_transform(X[:, 0])
```

Split the dataset into training and testing sets

```
X_train, X_test, y_train, y_test = train_test_split(X, y,
test_size=0.2, random_state=42)
```

Create a Random Forest classifier

```
rf_classifier = RandomForestClassifier(n_estimators=<mark>50</mark>)
```

Fit the model to the training data

```
rf_classifier.fit(X_train, y_train)
RandomForestClassifier(n_estimators=50)
```

Make predictions on the test set

```
y_pred = rf_classifier.predict(X_test)
```

Evaluate the performance of the classifier

```
accuracy = accuracy_score(y_test, y_pred)
conf_matrix = confusion_matrix(y_test, y_pred)
classification_report_str = classification_report(y_test, y_pred)
```

Print the results

```
print(f'RF Accuracy: {accuracy}')
print(f'RF Confusion Matrix:\n{conf_matrix}')
sns.set(rc={'figure.figsize':(6,3)})
sns.heatmap(confusion_matrix(y_test,y_pred),annot = True,fmt = 'd')
plt.xlabel('Predicted Labels')
plt.ylabel('Actual Labels')
print(f'RF Classification Report:\n{classification_report_str}')
```

```

                                                      80
```

Predict whether a targeted audience or person will purchase the product or not

```
# Assuming we have a new set of feature values for prediction
new_data = np.array([[0, 30, 50000]]) # Example: Gender (0 for
Female, 1 for Male), Age, Estimated Salary

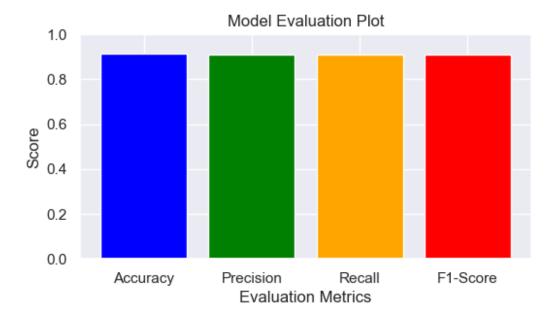

# Use the trained RF model to make predictions
predicted_purchase = rf_classifier.predict(new_data)

# Print the predicted outcome
if predicted_purchase[0] == 1:
    print("The targeted audience is predicted to purchase the
product.")
else:
    print("The targeted audience is predicted not to purchase the
product.")
```

The targeted audience is predicted not to purchase the product.

Output Visualization using Bar Plot

```
# Assuming we have already evaluated the model and obtained these
metrics, hence plotting the same in a bar plot
accuracy = 0.9125
precision = 0.91
recall = 0.91
f1 \text{ score} = 0.91
# Plotting the bar plot
metrics_names = ['Accuracy', 'Precision', 'Recall', 'F1-Score']
metrics values = [accuracy, precision, recall, f1_score]
plt.bar(metrics names, metrics values, color=['blue', 'green',
'orange', 'red'])
plt.ylim([0, 1]) # Set the y-axis limit between 0 and 1
plt.title('Model Evaluation Plot')
plt.xlabel('Evaluation Metrics')
plt.ylabel('Score')
plt.show()
```

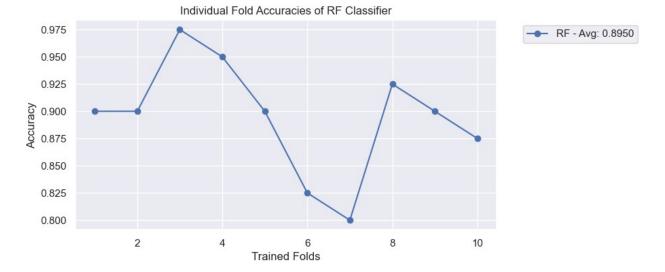

10-fold Cross-Validation

```
from sklearn.model_selection import cross_val_score, StratifiedKFold
from sklearn.metrics import make_scorer

# Define stratified 10-fold cross-validation
cross_val = StratifiedKFold(n_splits=10, shuffle=True,
```

Cross-Validation Result Visualization using Bar Plot

```
# Cross-Validation Result
model = ['RF']
accuracies = {
    'RF': [0.9, 0.9, 0.975, 0.95, 0.9, 0.825, 0.8, 0.925, 0.9, 0.875],
}
# Plotting
plt.figure(figsize=(8, 4))
for model in model:
    plt.plot(range(1, 11), accuracies[model], marker='o',
label=f'{model} - Avg: {sum(accuracies[model])/10:.4f}')
plt.title('Individual Fold Accuracies of RF Classifier')
plt.xlabel('Trained Folds')
plt.ylabel('Accuracy')
plt.legend(bbox to anchor=(1.05, 1), loc='upper left') # Placing the
legend outside the plot area
plt.show()
```

ROC Curve Plotting for the above RF Model

```
from sklearn.metrics import roc curve, auc
# Assuming y_test is the actual labels
label encoder = LabelEncoder()
y test binary = label encoder.fit transform(y test)
# Get predicted probabilities for the positive class
rf predicted scores = rf classifier.predict proba(X test)[:, 1]
# Compute ROC curve and AUC for RF model
rf_fpr, rf_tpr, _ = roc_curve(y_test_binary, rf_predicted_scores)
# Compute AUC for RF model
rf_roc_auc = auc(rf_fpr, rf_tpr)
# Plot ROC curve for RF model
plt.figure(figsize=(8, 6))
sns.set(style='darkgrid')
plt.plot(rf fpr, rf tpr, color='purple', lw=2, label=f'RF (AUC =
{rf_roc_auc:.2f})')
plt.plot([0, 1], [0, 1], linestyle='--', color='gray', label='Random')
plt.xlabel('False Positive Rate')
plt.ylabel('True Positive Rate')
plt.title('AUC-ROC Curve for RF Model')
plt.legend(loc='lower right')
plt.show()
```
